

FROGS FOR LIGHT RAILS

Design 97

The Welded Plate Frog, Design 97, is recommended for applications in mining, construction, and industrial facilities where lighter rail sections are in use.

Design 289

Design 289 features a single-piece structure crafted from cast manganese steel. Its one-piece design eliminates the risk of rivets or plates loosening over time. This model allows for quick installation and is durable enough to outlast multiple plate frogs. No splice bars are needed, as the rails are bolted directly to the plate arms. When required, special long, heat-treated bolts with beveled washers are provided. All frogs are manufactured with 1/2-inch points.
